

MOVE.ME Design Diemmebi R&D

The presence of an aluminum rotation mechanism, which can be operated comfortably through an ergonomic release handle, allows the metal structure to fold under the wooden top. This practical function can be used in combination with the classic rectangular tops, but also with square tops: the mechanism is designed to rotate and shift at the same time the legs sideways, preventing them from bumping into each other once folded. Move. me can be stored very easily and transported from one room to another thanks to the use of a trolley on castors. A freedom of movement that greatly amplifies its opportunities for use in meeting, educational and Horeca contexts. The availability of metal legs in round or square tube, both chromed and powder-coated, allows Move.me to adapt aesthetically to the furnishings surrounding it.
